NEWS RELEASE:

## ITT's PuriFile® software supports new systems and file formats

**ROME, N.Y., November 24, 2008** – ITT Corporation (NYSE:ITT) today announced the release of PuriFile 3.3, an advanced version of its document inspection software. ITT's PuriFile software finds hidden information in files and then, using an integrated assistant plug-in, helps cleanse the document. PuriFile 3.3 now provides full inspection and cleansing capability for the Microsoft Office 2007 format.

PuriFile detects and identifies hidden objects and metadata within Microsoft Office files, which could accidentally or maliciously disclose sensitive information or confidential digital assets.

Microsoft Word, Excel, and Powerpoint files have numerous opportunities for holding data not easily discovered during normal inspection and release procedures. The Microsoft Office 2007 format creates additional paths for data loss. PuriFile 3.3 includes full support for the Microsoft Office 2007 format, enabling users to properly protect their data.

In addition, PuriFile 3.3 now runs on Solaris 10 on x86, allowing for easier integration with a growing number of third party applications. The product is already in broad use on Microsoft Windows systems, and has also been incorporated into various cross domain solutions, such as the Information Support Server Environment (ISSE).

PuriFile 3.3 also provides additional tools and mechanisms for easy integration into existing active directory systems for user identification. This integration capability is of greatest interest to customers requiring enterprise deployment of PuriFile, such as the recent purchase by the U.S. Department of Defense.
